A wide-angle photograph of a waterfall, likely the Rhine Falls, set against a clear blue sky. A vibrant rainbow arches across the upper portion of the falls. In the background, there are green trees and some buildings, including a prominent red brick tower on the right. The water is turbulent and white at the base of the falls.

# **Challenges for the future: emerging micropollutants in urban water cycle**

**Thomas Ternes, Jessica Benner, Manoj Schulz, Adriano Joss,  
Hansruedi Siegrist**

## Chemicals used in the EU

- **100000 "old chemicals" until 1981**
  - **> 4000 "new chemicals" since 1981**
- 
- **30000 chemicals > 1 t yr<sup>-1</sup>**
  - **2900 chemicals > 100 t yr<sup>-1</sup>**
  - **2600 chemicals > 1000 t yr<sup>-1</sup>**

# Predicted application and production quantities

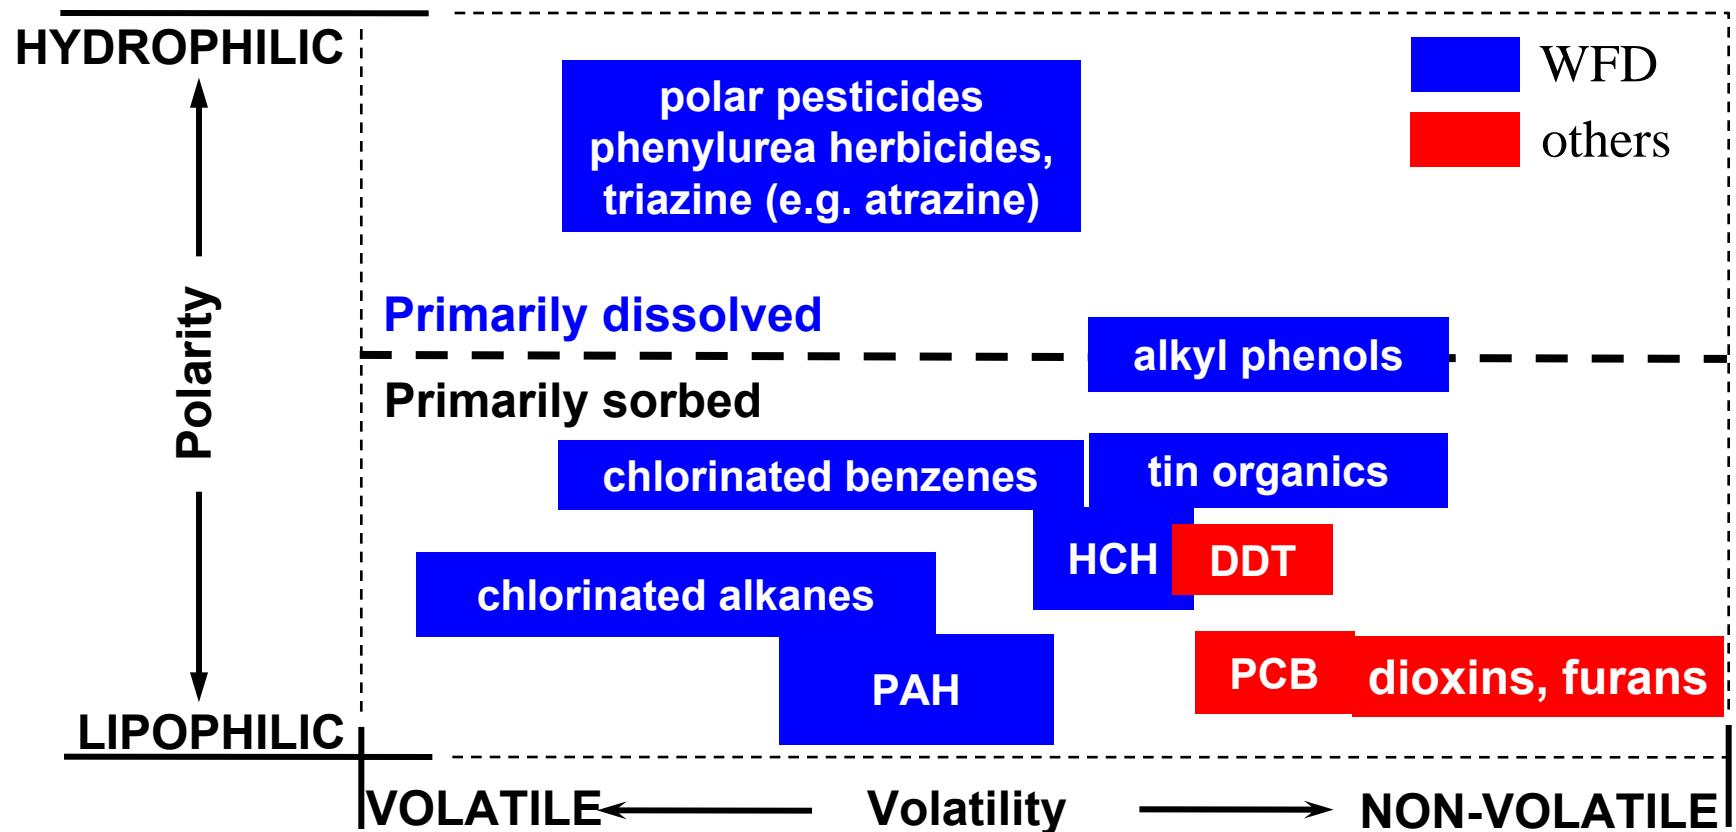

## Application quantities in Germany

- Human-use pharmaceuticals (ca. 2800): about 6500 t yr<sup>-1</sup>  
corresponds to 78 g cap<sup>-1</sup> yr<sup>-1</sup>
- Veterinary pharmaceuticals: about 1000 t yr<sup>-1</sup>
- Pesticides (ca. 200): about 30000 t yr<sup>-1</sup>
- Surfactants: 188629 t yr<sup>-1</sup> (2.3 kg cap<sup>-1</sup> yr<sup>-1</sup>)

## Production quantities in Germany

- Personal care products: > 500000 t yr<sup>-1</sup> (> 6.1 kg cap<sup>-1</sup> yr<sup>-1</sup>)
- EDTA: 29560 t yr<sup>-1</sup>

# Measures to remove emerging contaminants and their transformation products in the water cycle

## Environmental quality standards (EQS) of WFD

If EQS are exceeded (**probably for diclofenac, isoproturon, EE2, bisphenol A, ...**) advanced measures have to be established, in order to guaranty the good ecological/chemical status of rivers and streams until 2015.

# Processes for advanced municipal wastewater treatment to remove emerging pollutants

## Frequently transformation, sometimes mineralization

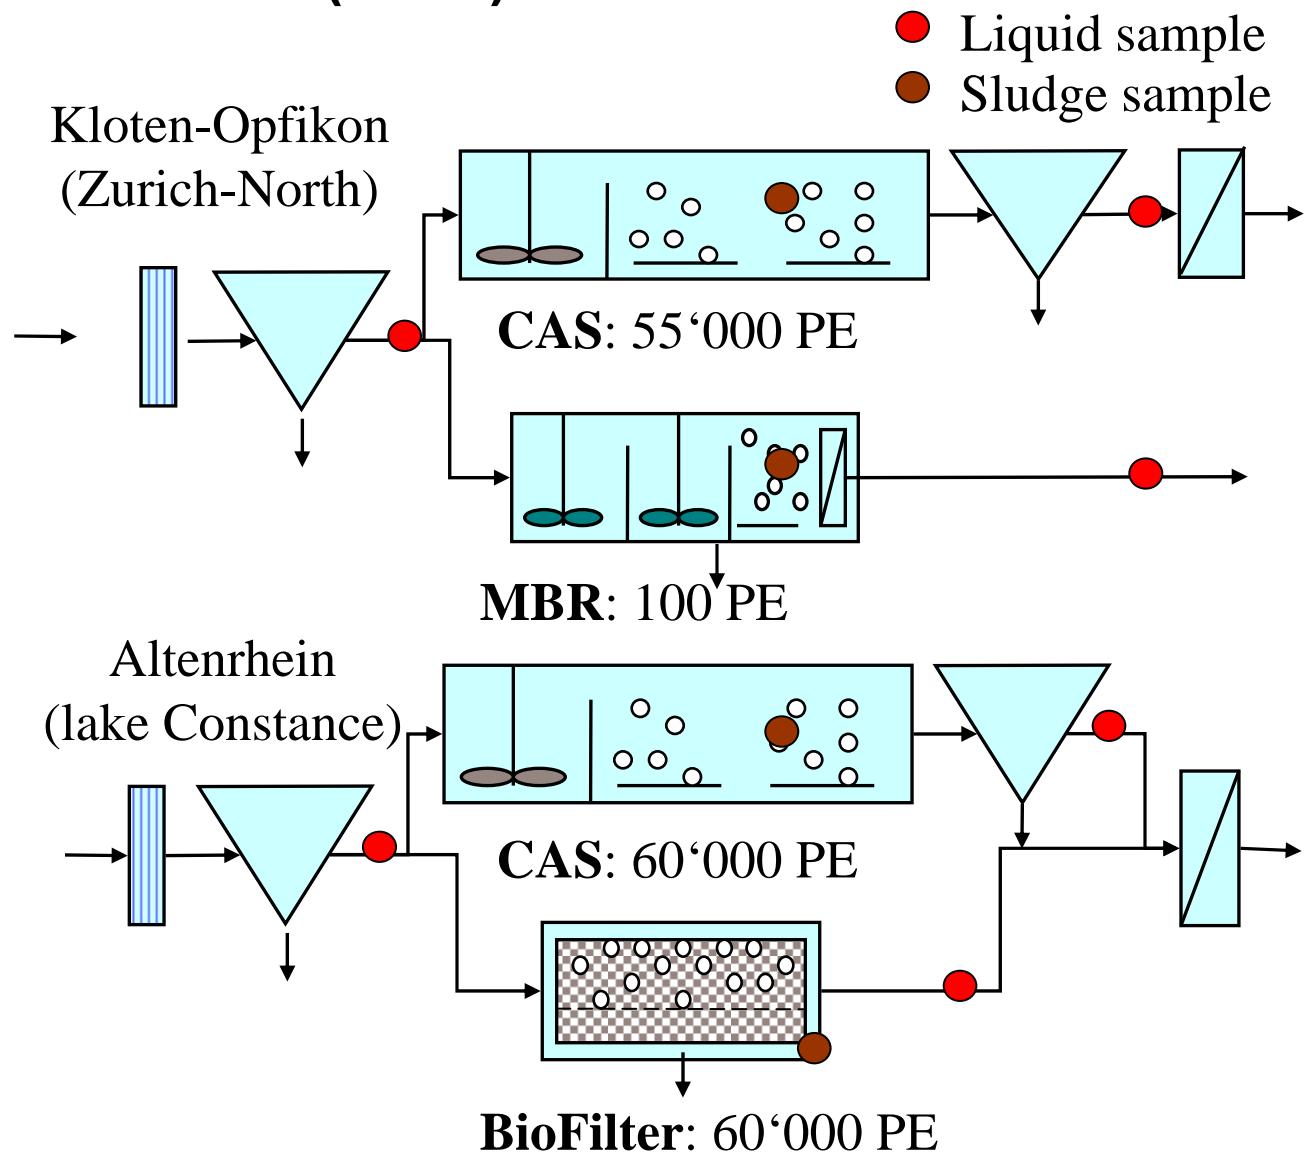

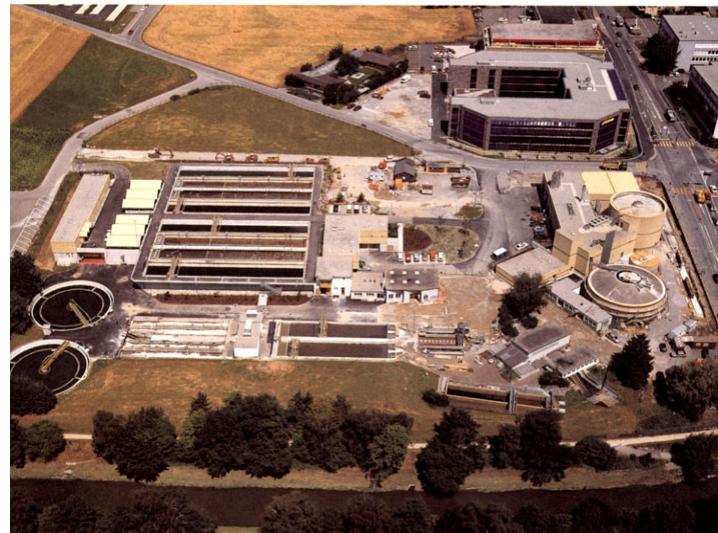

- **Biological degradation:** nitrification, denitrification
- **Chemical oxidation:** ozone, advanced oxidation
- **Photo(chemical)degradation:** UV/H<sub>2</sub>O<sub>2</sub>, sun light

## Quantitative removal

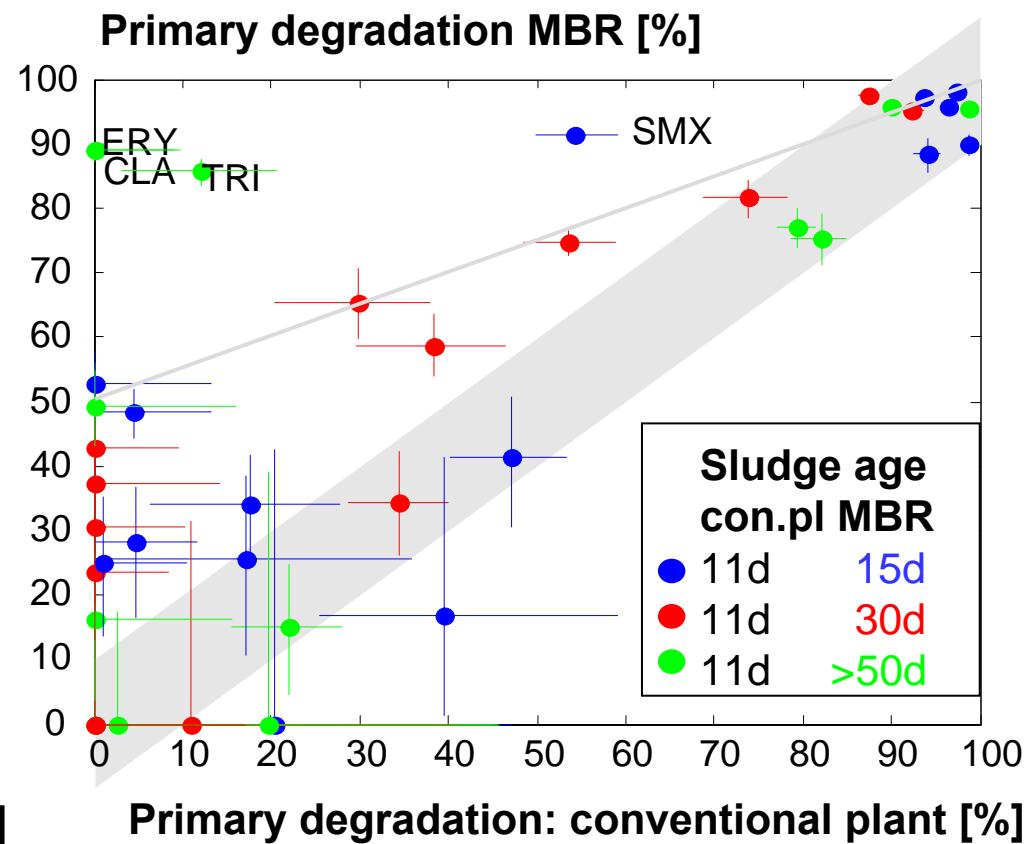

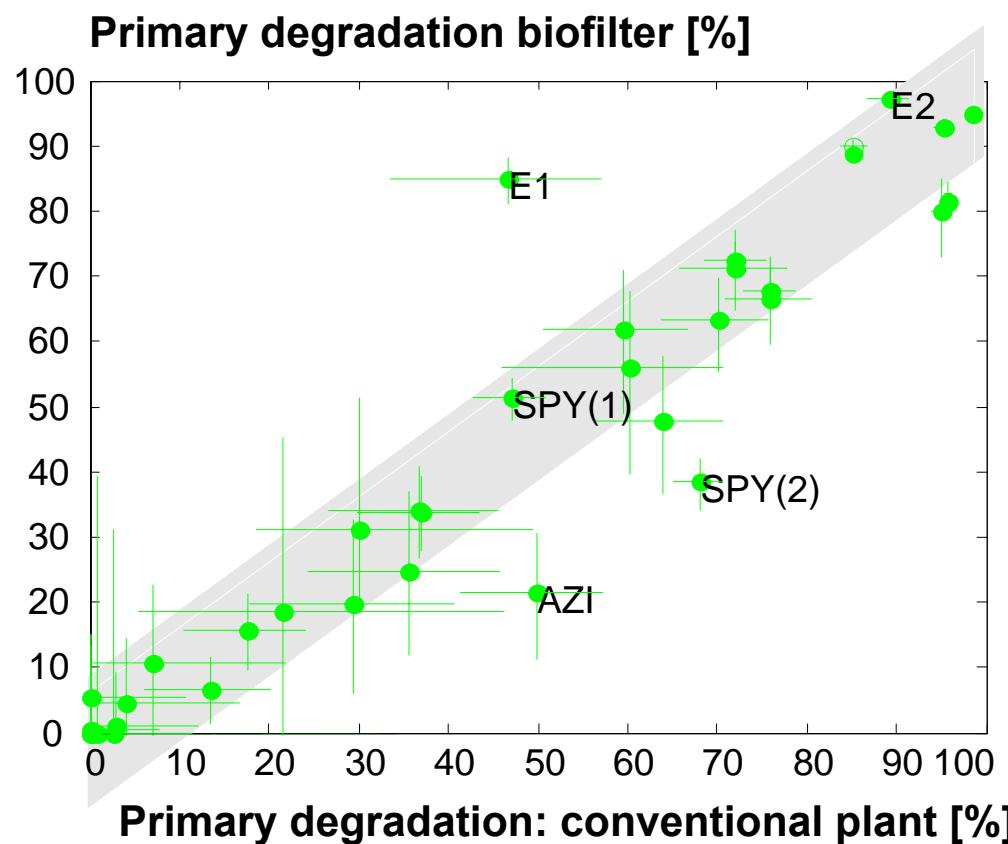

- **Sorption:** activated carbon (GAC, PAC)
- **Size exclusion:** dense membranes (nanofiltration, reverse osmosis)

# **Biological degradation (and sorption on sludge particle)**

**Feasible costs: ≤ 25 €/person/year  
(100 m<sup>3</sup>/(person·year))**

## Conclusions

Which „relevant“ emerging pollutants“ has to be considered?

Criterium 1: ecotoxicological or human toxicological relevance

Criterium 2: potential to contaminate ground water and drinking water

Criterium 3: biological TP fulfilling criteria 1,2

How to determine the success of a measure?

- Non-detection of a pollutant (sorption, degradation, size exclusion)
- Elimination of relevant TPs (biological, chemical)
- Models to transfer the results to other emerging pollutants or conditions

Which measures are economically and ecologically appropriate?

- Minimizing the direct risks for humans and the environment
- Taking into account the global impacts of the measure (green house effect)
- Costs should be justified by a success control (criteria: 1-3)
