LUSAKA CITY COUNCIL

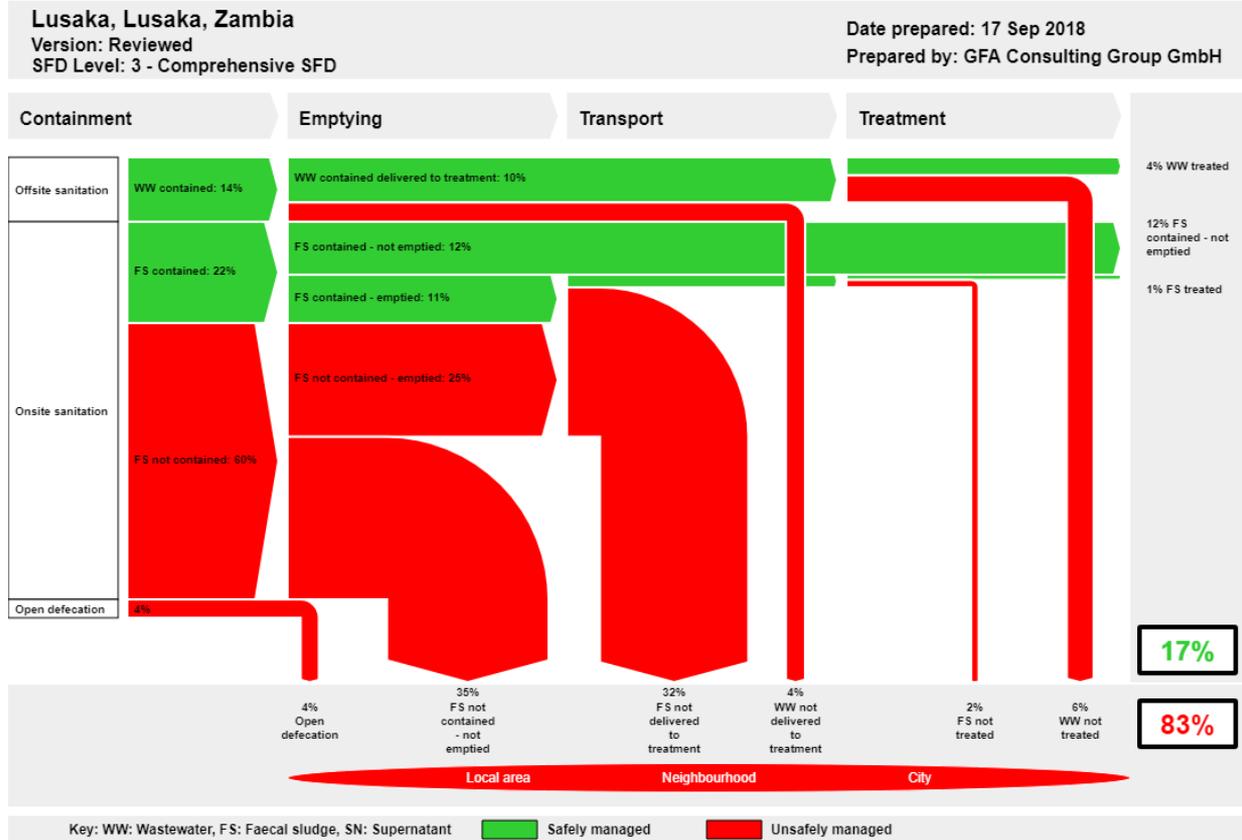

Presentation outline

- Introduction
- Study Site
- Sanipath process
- Pathways of exposure assessed
- Results
- Lessons learned
- Takeaways

Shit Flow

Analyses show that Fecal Sludge is NOT Contained – Reservoirs in Urban Environment

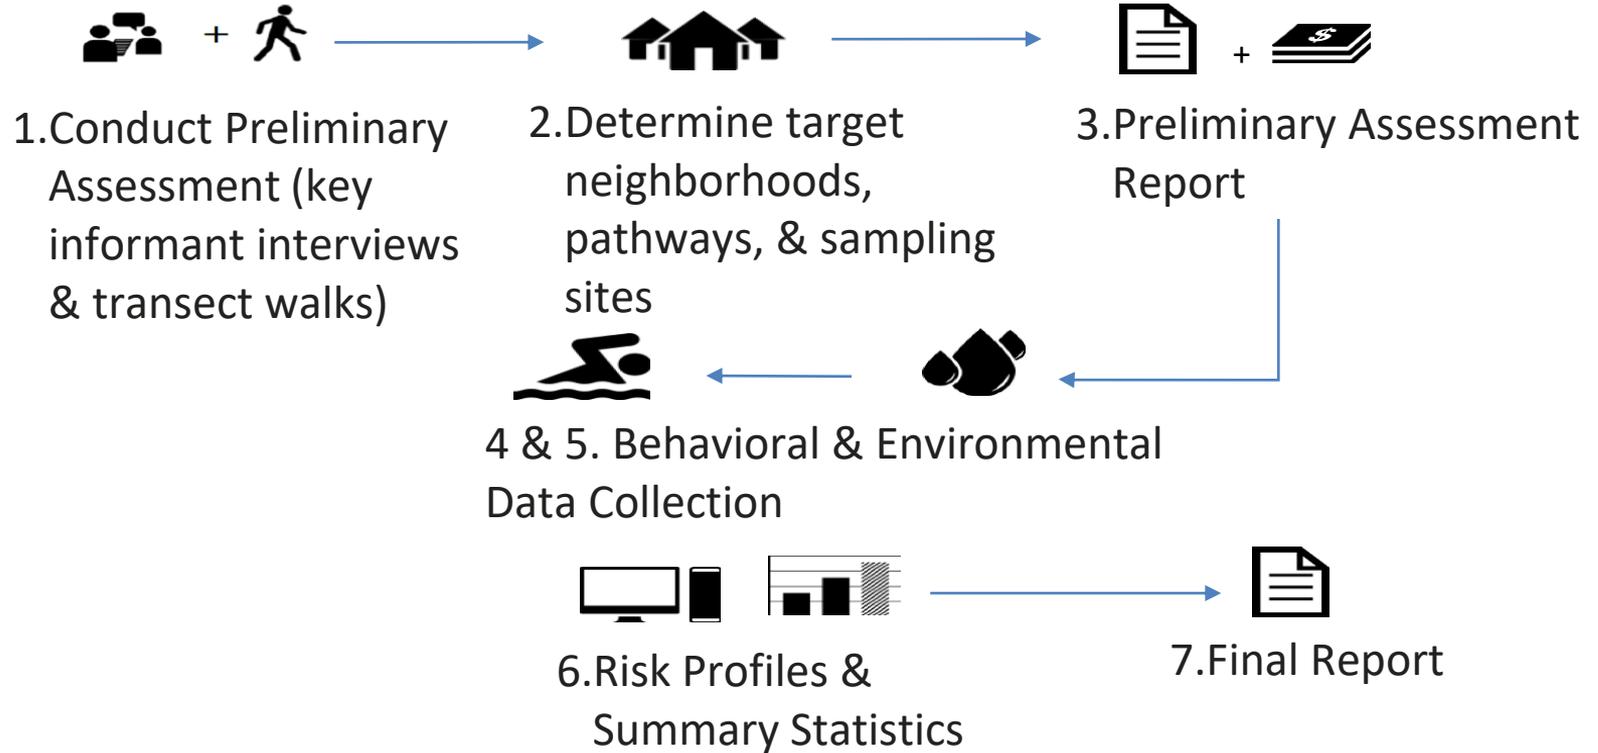

Produced with support from the SFD Promotion Initiative with funding from the Bill & Melinda Gates Foundation.
 The SFD Promotion Initiative recommends that this graphic is read in conjunction with the city's SFD Report which is available at: sfd.susana.org

Study Site – Kanyama Compound

- Kanyama is an unplanned, legalized settlement
- Population 169,298 (36,834 households)
- Lies on a highly productive and vulnerable dolomitic karst aquifer
- 4 boreholes that feed 163 individual water points supply water

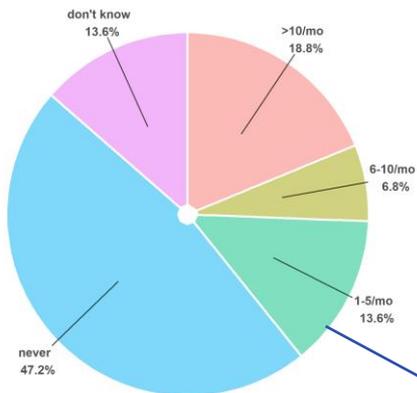

SaniPath overview

Estimating Exposure to Fecal Contamination

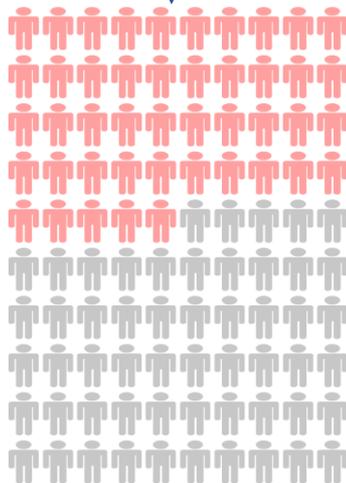

Behavior Frequency

Drain Water
Kanyama
250 (N=Adults)

Other parameters: intake volumes, duration of exposure, etc.

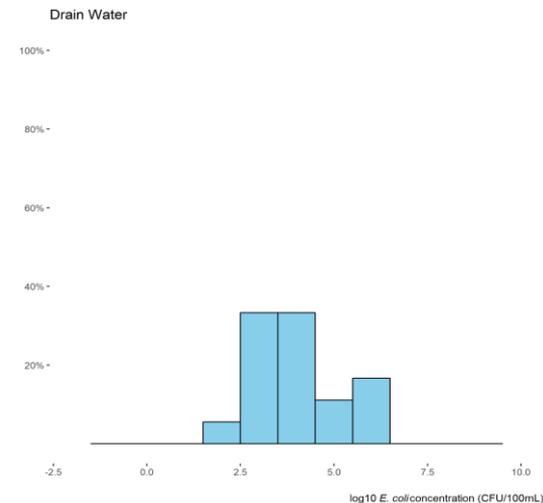

Drain Water
Kanyama
Adults
44.9% exposed
3.66 MPN/Month *E. coli*

Tool uses Bayesian analysis to estimate the distribution of environmental contamination and frequency of exposure.

The mean dose and proportion of the population exposed are summarized from simulated distributions and displayed in risk profiles.

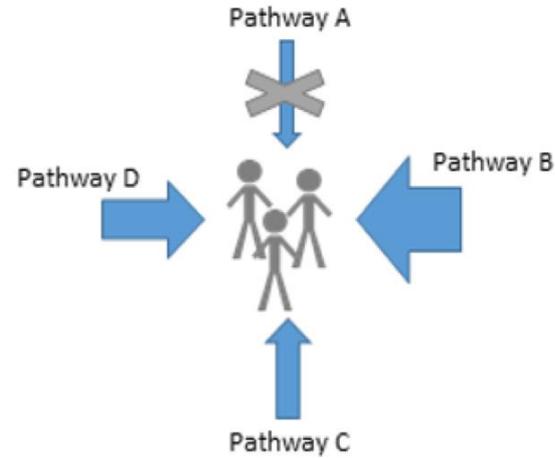

Environmental Contamination

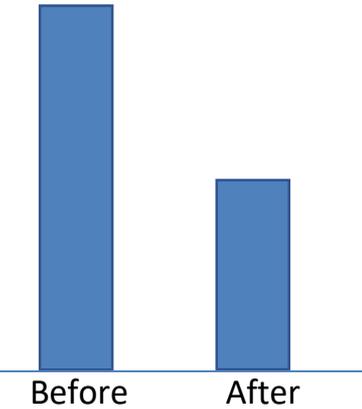

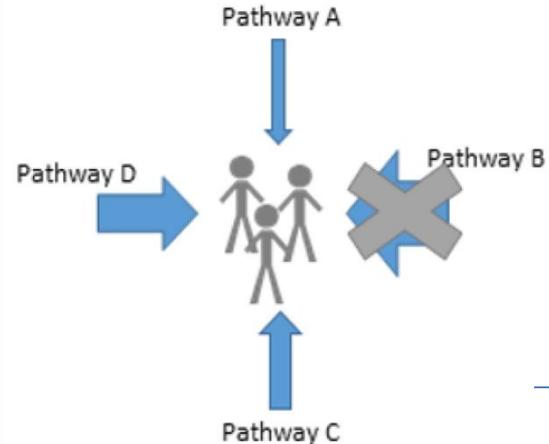

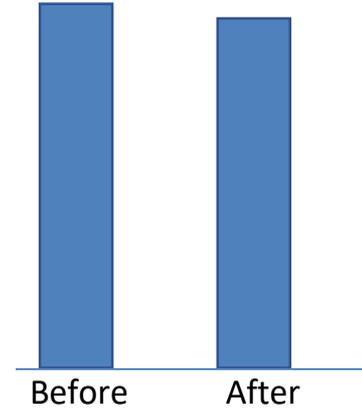

Results are presented in a normalized and comparable unit – Dose as MPN *E. coli* **ingested** per month

Dominant Pathway(s)

- The pathway(s) that make a great contribution(s) to the total exposure.
- Effects on exposure when a particular pathway is removed.
- Total exposure changes substantially when a **dominant pathway** is removed.

Total Exposure

Pathways of Exposure – SaniPath Lusaka

Municipal
Water

Borehole
Water

Shallow Well
Water

Open Drains

Soil

Street
Food

Raw
Produce

Public Latrines

Shared
Latrines

Flood Water

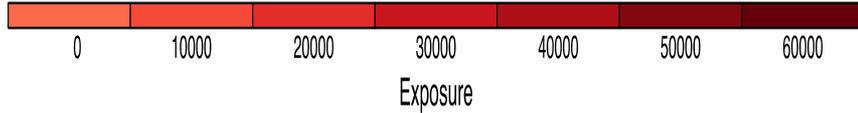

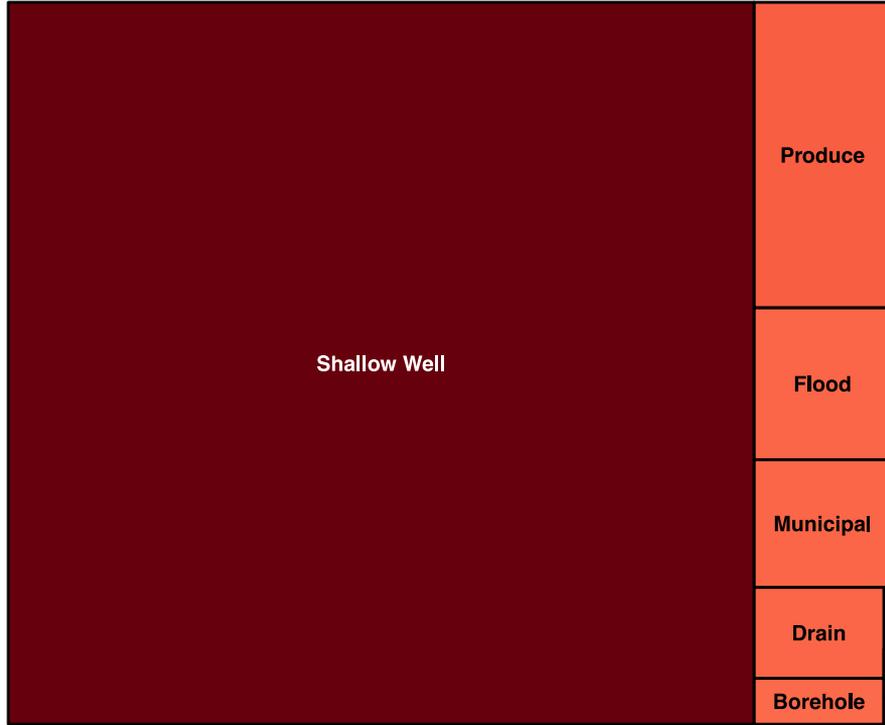

Behavioral Sample Sizes

	Household Surveys	Community Surveys	School Surveys
Number of Surveys	100	4	4
Total Number of Participants	100	79	73
Total Surveys	252		

Results: Exposure Assessment

Adult Exposure

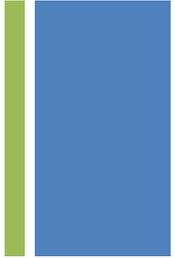

Child Exposure

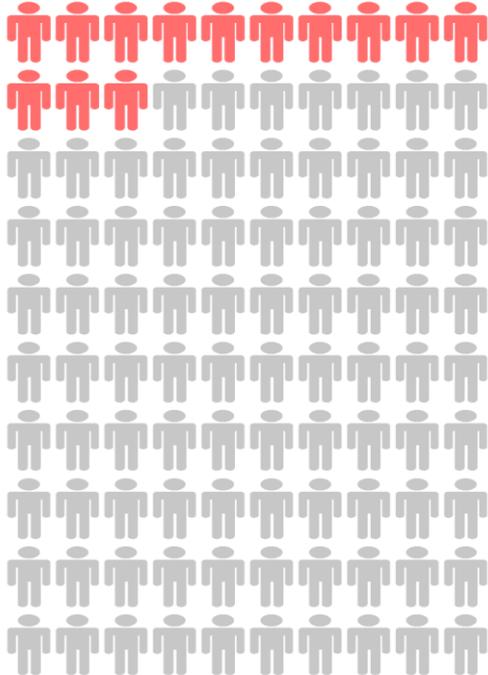

Action to bury Shallow Wells

Drinking Water, Shallow Well

Kanyama
Adults
12.6% exposed
5.615 MPN/Month *E. coli*

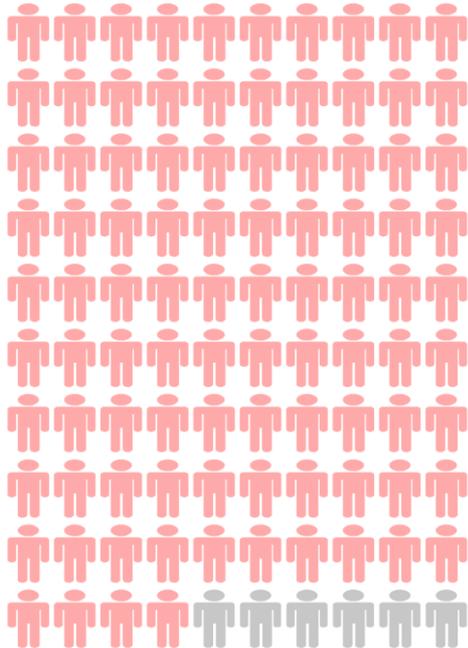

Children:

2.2% exposed, 3.811 MPN/Month *E. coli*

Vulnerability of Municipal Drinking Water

Municipal and Piped Water

Kanyama
Adults
93.9% exposed
3.29 MPN/Month *E. coli*

Children:
90.2% exposed, 2.798 MPN/Month *E.*

Lessons learned

- Adult dominant pathways vs children dominant pathways
- Shallow wells vs flood water vs open drains
- Sanitation and hygiene in relation to fresh produce
- downstream impacts of poor FSM on wholesome portable water

Takeaways

- Sanipath is a useful tool to provide information for targeted decision making in critical in the Zambian settings
- Alert decision makers of critical areas that are not otherwise considered for interventions.
- Results can be used to influence investment in critical intervention areas
- Impulsive reactions vs Informed decisions
